

The biggest change was implementing the change to the database to include a created date, as I had to make changes in 4 places. The database, the form that collects the input, how the products are displayed on the website, and the query that adds the product to the database. While not a hard change, it touched quite a few places in my website.

For the database, I simply went through and updated the table, and for any products already in the table, I went through and updated the column, as I only had a few entries in there for testing purposes.

On my website, I had to edit the form that allows the user to add a new product by adding a new field that allows the user to enter a date. I then had to update the query that adds a product to the table by allowing the new parameter to be passed to the function and stored in the database.

✔ Table products has been altered successfully.

```
ALTER TABLE `products` ADD `created_date` DATE NOT NULL AFTER `in_stock`;
```

```
<!-- Date product was created -->
<label>Created Date</label>
<input type="date" name="created_date" id = "created_date">

<input type="submit" name="op" value="Add Product">
```

```
reference
function add_product(PDO $pdo, array $values) {
    $sql = "INSERT INTO products (product_name, category, price, description, featured, in_stock, created_date)
    VALUES (:product_name, :category, :price, :description, :featured, :in_stock, :created_date)";
    $pdo->execute($sql, [
        ':product_name' => $values['product_name'],
        ':category' => $values['category'],
        ':price' => $values['price'],
        ':description' => $values['description'],
        ':featured' => $values['featured'],
        ':in_stock' => $values['in_stock'],
        ':created_date' => $values['created_date']
    ]);
}
```

The last change I made was when querying the products to be displayed; I ordered them by date.

The other changes were easier to implement as I just had to copy and paste the actual phrases, fix some spelling, colors, font size, etc.

To add the products, I just created a SQL script to add the products to the database.

The feedback helped improve the overall user experience and alignment with client goals by making sure the website I am creating for my client aligns with her goals. This made sure I am building what she envisioned and wanted. This also ensures that it will be easy for her to update, add, and delete products, as one of her requests was that she didn't want to have to do it directly through the database, but rather through an interface on the page where she can manage everything. This ensures this update_prod page has all the functionality she needs.

I implemented all the suggestions she had, as most were UI related and made sense.
