

Meeting Date/Time: March 29, 2026, 6:00 pm

Meeting Location: In-person meeting

Meeting Summary: The main discussion was whether she liked the layout of the product cards as well as the overall look of the site. I walked through each page explaining the features/content on each page. The other major point was whether she liked the layout for adding/updating/deleting products on the update_prod page. Feedback from others in the past has been to decrease the white space, so it doesn't look so empty, which I did implement, as well as increasing the text size, which was also done. My client approved the visual look and the changes made to the color background.

Meeting changes:

The client agreed with the changes made to the original UI and approved of the new color palette, text font, and style.

One change request is that the delete option is currently a single select, and my client wants the option to be able to delete multiple products at once. This will be implemented by changing the drop-down to a multi-select, and the PDO function will take a list of product IDs to be deleted.

There are a couple of typos that need to be addressed, and I have a list of sentences/phrases to add to the site in place of the place holders I have been using. These will just be manually added to the source code.

I have also got a list of products with images, so I can go through and add the actual products to the database with their image. This will be done using the website to upload some of the products to test the effectiveness of the DB management functionality, while the rest will be added using SQL.

Another change request was that the products be sorted by creation date when being displayed to the user. This will be implemented by adding a new column in the database and a new field in the upload form that takes in a creation date to store.

The logout option should also be a button, not just text, so it is more easily distinguishable. I will implement this by going from text to a button which already has the CSS defined.
